FAISAL, FAWAZ MD
1218 W. OLIVE AVE
BURBANK, CA 91506

PATIENT NAME: RIGLIETTI, ROBERT MRN: 1288626
DOB: 07/30/1995 AGE: 29

EXAM DATE: 03/14/2025 ACCESSION: 3996301
MODALITY: MRI
EXAMINATION: MR BRAIN W/WO

IMPRESSION:

1. There is no evidence of mass, hemorrhage, extra-axial fluid collection or acute cortical infarction. This is an unremarkable MRI of the brain with and without contrast. As compared to the prior examination dated 1/16/2024, there is no interval change.

INDICATION:

Brain fog and memory loss.

COMPARISON:

MRI of the brain without contrast dated 1/16/2024.

TECHNIQUE:

Using the GE high field 1.5 Tesla HDXT MRI scanner, the following sequences were obtained of the brain without and with contrast:

1. Axial T1
2. Axial T2
3. Axial FLAIR
4. Sagittal T1
5. Axial DWI
6. Coronal GRE T2*
7. Axial SWI

After the intravenous administration of 15 cc of Dotarem, the following sequences were obtained:

1. Axial T1
2. Coronal T1 FS

FINDINGS:

NAME: **ROBERT RIGLIETTI** DOB: **07/30/1995** Exam Date:**03/14/25** MRNO:**1288626**

The sulci, cisterns and ventricles are symmetric in size, shape and configuration. There is no evidence of mass, hemorrhage, extra-axial fluid collection or acute cortical infarction. As compared to the prior examination, there is no interval change. There is no volume loss. There is no evidence of abnormal enhancement.

There are no foci of high FLAIR or T2 signal intensity in the subcortical or periventricular deep white matter. The susceptibility weighted images are unremarkable. The diffusion-weighted images are normal. There is no evidence of restricted diffusion.

There is no evidence of sellar or suprasellar mass. The cerebellar tonsils are in anatomic location. The orbits and intraorbital contents are unremarkable.

The paranasal sinuses are normal. The scalp and calvarium are unremarkable. The mastoid air cells are unremarkable. The nasopharynx and nasopharyngeal mucosal are unremarkable. The midline structures are unremarkable.
