Name: Riglietti Robert
Patient ID: 10109220
Date of Birth: 07/30/1995
Date of Service: 20241126103000 Nov 26, 2024 10:30

INDICATION: Neck pain

COMPARISON: None.

TECHNIQUE: Sagittal T1, sagittal STIR, sagittal and axial T2, and axial gradient echo images were obtained of the cervical spine.

FINDINGS:

There is reversal of the cervical lordosis.

The vertebral bodies are normal in height.

The disc spaces are desiccated and narrowed at C2-3 through C6/7.

The paraspinal soft tissues are normal.

The spinal cord signal is normal.

LEVEL BY LEVEL:

C1-C2: No significant degenerative changes. No canal stenosis.

C2-C3: Unremarkable appearance of the disc. No significant facet joint degeneration. No spinal canal or neural foraminal stenosis.

C3-C4: 2 mm disc bulge with mild bilateral vertebral enlargement and facet disease. Moderate bilateral neural foramen stenosis without spinal canal stenosis.

C4-C5: 1 mm disc bulge and mild bilateral uncovertebral enlargement without spinal canal or neural foramen stenosis.

C5-C6: 2 mm disc bulge with mild bilateral uncovertebral enlargement and facet disease. Mild

bilateral neural foramen stenosis without spinal canal stenosis.

C6-C7: Unremarkable appearance of the disc. No significant facet joint degeneration. No spinal canal or neural foraminal stenosis.

C7-T1: Unremarkable appearance of the disc. No significant facet joint degeneration. No spinal canal or neural foraminal stenosis.

IMPRESSION:

1. With reversal of midcervical lordosis.
2. Moderate bilateral neural foramen stenosis at C3-4.
3. Mild bilateral neural foramen stenosis at C5/6.

Kamron Izadi, M.D.
Diplomate of the American Board of Radiology
Certificate of Added Qualification (CAQ), Neuroradiology
